

MC-Injekt GL-95 TX

The new dimension in hydrostructural resins

- permanent elasticity
- tenacious bonding
- unique skin effect
- improved environmental acceptance

New structure...

The retro sealing of large areas or joints in existing structures, to prevent water ingress, is a sophisticated operation. Revealing the buried structure is often impossible or extremely difficult. A sound and reliable alternative is the curtain injection technique using MC-Injekt GL-95 TX. By drilling through the structure to the interface between the waterproofing membrane (or the protection board) a hydrostructural gel can be injected that cures to form an elastic membrane forming an impervious seal.

MC-Injekt GL-95 TX – the new dimension in hydrostructural resins

A unique formulation

MC-Injekt GL-95 TX is a hydrostructural resin with high mechanical and chemical resistance. It is environmentally friendly and extremely durable. This combination of properties makes MC-Injekt GL-95 TX what it is: unique!

- **permanent elasticity**

The permanent, long term elasticity gives excellent deformation characteristics even under low impact.

- **tenacious bonding**

MC-Injekt GL-95 TX adheres to almost every surface, rough or smooth.

- **isotropic bonding**

The hydrostructural resin increases its volume by incorporating water. Due to hydrophilic groups in the resin structure the water is “stored” as a filler.

- **unique skin effect**

MC-Injekt GL-95 TX forms a protective skin when in contact with dry air that seals the water into the gel structure.

- **improved environmental acceptance**

MMC-Injekt GL-95 TX is certified for use with potable and ground water including contact over wide areas.

Injected construction joint

MC-Injekt GL-95 TX is the system of choice for injection of movement joints and applications where large dimensional changes are anticipated. It is also the perfect solution for sealing against water ingress where membrane failure has occurred.
